The present sequence is a sphingolipid desaturase from clone wre1.pk0004.c7:fis isolated from wheat etiolated seedling root cDNA library, wre1.

The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase which in turn would alter the fatty acid composition. The enzyme is also useful for producing polyclonal or monoclonal antibodies. The polynucleotide is useful as primer or probe for screening cDNA libraries to
                                                                                                                                                                                                                                                                                        Polynucleotide encoding delta-6 desaturase enzyme useful transgenic plants and for producing antibodies specific useful for screening cDNA expression libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    seedling root cDNA library, wre1. The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase which in turn would alter the fatty acid composition. The enzyme is also useful for producing polyclonal or monoclonal antibodies. The polynucleotide is useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                                                                                                                                             Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cahoon

                                                                                                                                                                                                                    The present sequence is a sphingolipid desaturase from clone cdelc.pk001.08:fis isolated from corn developing embryo cDNA library, cdelc. The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase which in turn would alter the fatty acid composition. The enzyme is also useful for producing polyclonal or monoclonal antibodies. The polynucleotide is useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Corn
                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polynucleotide encoding delta-6 desaturase enzyme useful for producing transgenic plants and for producing antibodies specific to which is useful for screening cDNA expression libraries -

The delta-6 desaturase enzyme catalyses the formation of tariric acid, a fatty acid that has a triple bond at the delta-6 carbon. The present sequence is useful for producing transgenic plants having altered levels of delta-6 desaturase which in turn would alter the fatty acid composition. The enzyme is also useful for producing polyclonal or monoclonal antibodies. The polynucleotide is useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.

                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel sphingolipid desaturase that selectively introduces a double bond into the sphingolase of the ceramide residue of sphingolipids and capnoids. A DNA sequence encoding the sphingolipid desaturase, or a vector containing the DNA sequence, can be used to produce transgenic plants, especially crop plants, with an increased or decreased delta-8-unsaturated long-chain base content or an altered delta-8-unsaturated long-chain base content or an altered delta-8-unsaturated long-chain base deficiency, to compensate for a delta-8-unsaturated long-chain base deficiency, to exclude production of delta-8-unsaturated bases, to increase tolerance or resistance to soil salinity, ion stress or toxicity, drought, wet conditions, cold or frost and/or phytopathogenic microorganisms or to alter size growth and flowering time. Cells, transgenic organisms or plants containing the DNA sequence can be used to produce sphingolipids and capnoids with unsaturated sphingobases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw materials. This sequence represents a sphingolipid desaturase protein
                                                                                                                                                                                                                                                                                                      Best Loc

The present sequence is useful for producing transgenic plants having altered levels of sphingolipid desaturase which in turn would alter the fatty acid composition. The enzyme is also useful for producing polyclonal or monoclonal antibodies. The polynucleotide is useful as primer or probe for screening cDNA libraries to isolate desired full-length cDNA clones.
                                                                                                                      maize; tobacco; peanut; carrot; oil seed

19-SEP-1997;
10-OCT-1991;
                                                                                                                                                                                                                                   for producing a plant (such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant) with increased gamma-linolenic acid (GLA) content by transforming a plant cell with the nucleic acid or vector and regenerating a plant with increased GLA content from the plant cell, for inducing or increasing production of GLA in an organism lacking in or producing low levels of GLA and for inducing production of or production cacid in at least one of a plant deficient or lacking in or producing low levels of octadecaterraenoic acid, a bacterium which produces alpha-linolenic acid or a bacterium which exhibits a delta-15-desaturase activity on a GLA substrate. This sequence represents an evening primrose delta-6-desaturase polypeptide.
                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a nucleic acid encoding an evening primrose delta-6-desaturase polypeptide. The nucleic acid, a vector comprising nucleic acid or a nucleic acid encoding delta-12-desaturase, is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel nucleic acid encoding evening primrose delta-6-desaturase, for producing plant with increased gamma linolenic acid content, for inducing octadecatetraenoic acid production in plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 15; Fig 11;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               primrose Delta6-desaturase. The nucleic acid and a vector expressing the nucleic acid are useful for producing a plant such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant, with increased gamma linolenic acid (GLA) content, and also for inducing or increasing production of GLA in a bacteria or plant deficient, lacking in or producing low levels of GLA. The nucleic acid is also useful for inducing chilling tolerance in plants. This is the amino acid sequence of the evening primrose delta6 desaturase involved in the production of gamma increase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10-OCT-1991;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a nucleic acid encoding an evening primrose delta-6-desaturase polypeptide. The nucleic acid, a vector comprising the nucleic acid or a nucleic acid encoding delta-12-desaturase, is useful for producing a plant (such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant) with increased gamma-linolenic acid (GLA) content by transforming a plant cell with the nucleic acid or vector and regenerating a plant with increased GLA content from the plant cell, for inducing or increasing production of GLA in an organism lacking in or producing low levels of GLA and for inducing production of or producing low levels of GLA and for inducing production of or producing low levels of octadecaterraenoic acid, a bacterium which produces alpha-linolenic acid or a bacterium which exhibits a delta-15-desaturase activity on a GLA substrate. This sequence represents an evening primrose delta-6-desaturase polypeptide.
                                                                                                                                                                                                            21-DEC-2001;
                                                                                                                                                                                                                                                                  08-AUG-2002

The nucleic acid, a vector comprising the nucleic acid or a nucleic acid or a nucleic acid or a sunflower, soybean, malze, tobacco, peanut, carrot or oil seed rape plant) with increased gamma-linolenic acid (GLA) content by transforming a plant cell with the nucleic acid or vector and regenerating a plant with increased GLA content from the plant cell, for inducing or increasing production of GLA in an organism lacking in or producing low levels of GLA and for inducing production of GLA in an organism lacking in or producing low levels of EAA and for inducing production of GLA producing low levels of octadecatetraenoic acid, a bacterium which produces alpha-linolenic acid or a bacterium which exhibits a delta-15-desaturase activity on a GLA substrate. This sequence represents a borage delta-6-desaturase polypeptide.
                                                                                                                                                                          Region
                                                                                                                                                                                                            Region
                                                                                                                                                                                                                                                                                               Delta-6-desaturase; gamma-linolenic acid; transgenic plant; polyunsaturated fatty acid; octadecatetraeonic acid; chilling resistance; oilseed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acid encoding evening primrose delta-6-desaturase, for producing plant with increased gamma linolenic acid content, for inducing octadecatetraenoic acid production in plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

Its sequence was deduced from that of the delta-6-desaturase gene (ART30395) isolates from a borage membrane-bound polysomal library. The sequence is distinct from that of Synechocystis delta-6-desaturase (AAR98456). Expression of the desaturase in transgenic plants, esp. sunflower, soybean, maize, tobacco, peanut, carrot or oilseed rape, results in increased GLA prodn. Alteration of the plant membrane lipids as a result of expression of the desaturase may also result in increased resistance to chilling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

Delta-6 desaturase cDNA (see AAX24917) was isolated from a borage membrane-bound polysomal cDNA library using a partial clone, obtained from an EST database search, as probe. The borage delta-6 desaturase nucleic acid can be operably linked to the seed-specific 5' regulatory region (see AAX24916) of the Arabidopsis thaliana oleosin AtS21 gene in claimed expression cassettes of the invention. Transgenic plants, e.g. sunflower, soybean, maize, tobacco, cotton, peanut, oilseed rape or Arabidopsis are obtained that show increased levels of GLA or octadecatetrasenic acid. The levels of desirable fatty acids in oilseed crops can be manipulated to provide seed oils of use in human health and industrial applications.

A DNA sequence encoding the sphingolipid containing the DNA sequence, can be used to produce transgenic plants, especially crop plants, with an increased or decreased delta-8-unsaturated long-chain base content or an altered compensate for a delta-8-unsaturated long-chain base content or containing to compensate for a delta-8-unsaturated long-chain base deficiency, to exclude production of delta-8-unsaturated bases, to increase tolerance corresistance to soil salinity, ion stress or toxicity, drought, wet conditions, cold or frost and/or phytopathogenic microorganisms, or to calter size growth and flowering time. Cells, transgenic organisms or collater size growth and flowering time. Cells, transgenic organisms or capnoids with unsaturated sphingobases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw materials. This sequence represents a desaturase protein, HADES, isolated from Helianthus annuus (sunflower) which is used in the method of the

                                                                                                                                                                                                                                                                                    primrose Delta6-desaturase. The nucleic acid and a vector expressing the nucleic acid are useful for producing a plant such as sunflower, soybean, maize, tobacco, peanut, carrot or oil seed rape plant, with increased gamma linolenic acid (GLA) content, and also for inducing or increasing production of GLA in a bacteria or plant deficient, lacking in or producing low levels of GLA. The nucleic acid is also useful for inducing chilling tolerance in plants. This is the amino acid sequence of the borage delta6 desaturase involved in the production of gamma linoleic acid.
                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel nucleic acid encoding evening primrose delta6-desaturase which converts linoleic acid to gamma linolenic acid useful for producing gamma linolenic acid in transgenic plant or bacteria -
                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes an isolated nucleic acid encoding an evening primrose Delta6-desaturase. The nucleic acid and a vector expressing

mitted (MAR-1996) to the EMBL/GenBank/DDBJ databases.
FUNCTION: Membrane bound hemoprotein which function as an elecarrier for several membrane bound oxygenases (By similarity)
SUBCELLULAR LOCATION: MICROSOMAL MEMBRANE. BOUND TO THE
CYTOPLASMIC SIDE OF THE ENDOPLASMIC RETICULUM (BY SIMILARITY)
SIMILARITY: BELONGS TO THE CYTOCHROME B5 FAMILY.
                                                                                                                                                                                                                                                                                                                                        62

Step of nitrate assimilation in plants, fungi and bacteria. CAPALYTIC ACTIVITY: Nitrite + NAD(+) + H(2)(0) = nitrate + NF COPACTOR: EACH SUBUNIT OF THE ENZYME CONTAINS 1 EQUIVALENT HEME IRON, AND MOLYBDENUM-PTERIN AS PROSTHETIC GROUPS. THE GROUP IS CALLED CYTOCHROME B-557.
ENZYME REGULATION: REGULATED BY THE NITROGEN SOURCE AND CONBY THE CIRCADIAN RHYTHM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           carrier for several membrane bound oxygenases. SUBCELLULAR LOCATION: MICROSOMAL MEMBRANE. BOUND CYTOPLASMIC SIDE OF THE BUDOPLASMIC RETICULUM (B SIMILARITY: BELONGS TO THE CYTOCHROME B5 FAMILY.
